Discontinued

Antenna System Detail Kit

#190-474 Plastic, #190-455 Brass

Lost wax brass supports and receivers, less .020 dia. wire.

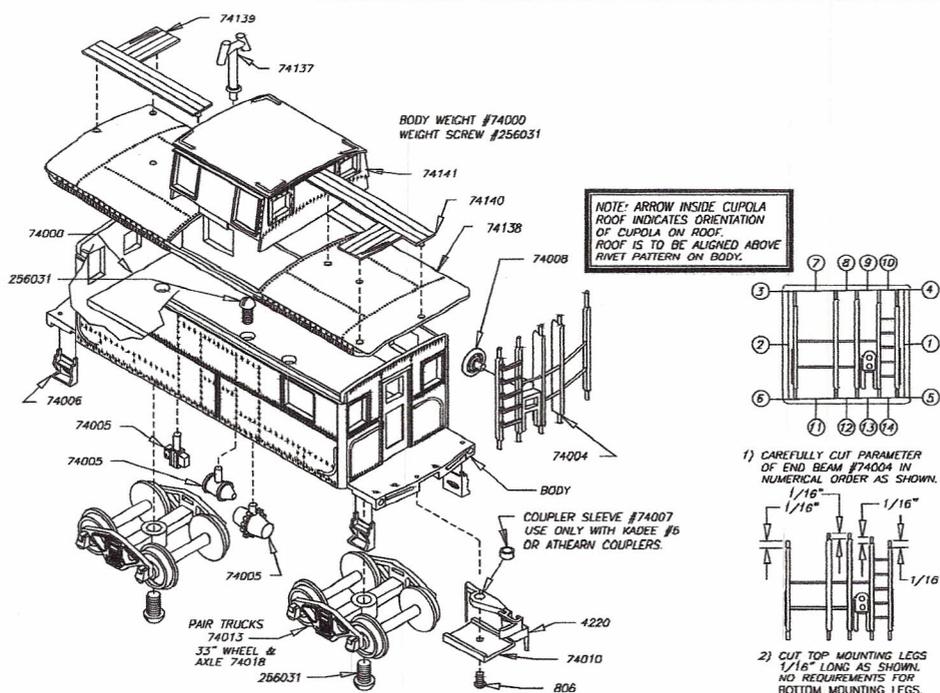

(Drill spots for locating antenna system supports are molded into underside of roof)

PRR N-5 CABOOSE

The N-5 is the world's first all steel cabin car. Produced in 1914 by Lines East these cars were equipped with archbar, leaf spring trucks and small tool boxes under their sides. While it was referred to as a center cupola, the N-5 cupola was actually 12 1/2" off center. It had a brake lever on each end of the platform instead of the brake wheel. Over the years some changes occurred. the top lights and tool boxes were removed, Ajax brake wheels replaced the brake levers, AB brakes replaced the K style, and coil spring trucks replaced by leaf spring trucks. New end sills, collision posts and new end railings were added. The stove and chimney were moved from the end of the car closer to the cupola. There were a total of 616 cars built in this era.

Body is injection molded plastic with a separate roof, one piece molded trucks with 33" wheels, and X2f couplers. Coupler pocket accepts KD #5. Antenna support system not included. **(Drill spots for locating antenna system supports are molded into underside of roof).**
